Portfolio: <https://deepak-774.github.io/Portfolio/index.html>

Developer with hands-on Android app development experience using Java, XML, and Android Studio. Seeking opportunities to build reliable apps while continuously improving technical skills.

Skills

Android Studio, Java, XML, FlutterFlow, Firebase, Python, HTML, CSS

Projects

Smart Code Review Agent

A Flask-based webhook server that automates code reviews by listening to GitHub PR events, fetching diffs via GitHub API, sending them to Google Gemini for AI-powered code review, and posting structured markdown feedback as PR comments. Supports interactive follow-ups when developers reply with "AI Review" comments. Built with Flask, GitHub REST API, and Google Gemini API.

Currency Converter Application

A clean, dark-themed UI built with XML/LinearLayout that lets users convert between 6 pre-defined currency pairs (Indian Rupees ↔ US Dollars, Indian Rupees ↔ Japanese Yen, Indian Rupees ↔ Mexican Peso) via a Spinner dropdown. Features real-time conversion as you type using hardcoded exchange rates, with dynamic label updates showing the selected "from" and "to" currencies. Built with Java Android SDK using TextWatcher for instant calculation feedback.

Education

B.Tech – Computer Science and Engineering

G. H. Rasoni College of Engineering and Management, Nagpur
8.05 CGPA

Experience

6 Month Internship

Remote

BoostNow Solution LLP

Jul 2025 – Dec 2025

During this 6-month internship, I worked on 2 projects with a team of interns:

Dastarkhawn Restaurant System: A dual-app food delivery ecosystem: (1) Customer-facing restaurant app for browsing menus, placing orders, and tracking deliveries; (2) Delivery partner app for rider registration, order assignment, and real-time navigation. Integrated with a central admin panel for order/rider management. Built entirely in FlutterFlow with MongoDB backend for database management, REST APIs for order processing, and real-time location tracking.

Full2Win Gaming Platform: Cross-platform gaming app featuring: WebView-integrated HTML/CSS/JS games (sourced from GitHub, separately hosted), social features (friends system, real-time challenges), and dynamic leaderboards per game. Implemented Firebase backend for user auth, friend connections, challenge logic, and score persistence.
